

- and a p75 neurotrophin receptor under conditions which, in the absence of the agent, permit the formation of a complex between the NADE protein and the receptor;
- (b) determining the amount of complex formed in step (a) between the NADE protein and the receptor; and
 - (c) determining whether the amount of complex determined in step (b) is less than the amount of complex formed in the absence of the agent, such lower amount indicating that the agent decreases apoptosis.

135. (Amended) A method for determining whether an agent increases apoptosis comprising:

- H3
cont
- (a) contacting the agent with a NADE protein and a p75 neurotrophin receptor under conditions which, in the absence of the agent, permit the formation of a complex between the NADE protein and the receptor;
 - (b) determining the amount of complex formed in step (a) between the NADE protein and the receptor; and
 - (c) determining whether the amount of complex determined in step (b) is greater than the amount of complex formed in the absence of the agent, such greater amount indicating that the agent increases apoptosis.

136. (Amended) The method of claim 134 or 135, wherein the NADE protein comprises the amino acid sequence

H3 cont as set forth in SEQ ID NO:13.

141. (Amended) A method for determining whether an agent decreases apoptosis comprising:

- H4
- (a) contacting the agent with a cell that expresses a NADE protein and a p75 neurotrophin receptor;
 - (b) determining the expression level of the NADE protein in the cell; and
 - (c) determining whether the expression level determined in step (b) is lower than the NADE protein expression level determined in the absence of the agent, such lower expression level indicating that the agent decreases apoptosis.

142. (Amended) A method for determining whether an agent increases apoptosis comprising:

- (a) contacting the agent with a cell that expresses a NADE protein and a p75 neurotrophin receptor;
- (b) determining the expression level of the NADE protein in the cell; and
- (c) determining whether the expression level determined in step (b) is greater than the NADE protein expression level determined in the absence of the agent, such greater expression level indicating that the agent increases apoptosis.

143. (Amended) The method of claim 141 or 142, wherein the
